Mount Maunganui South

Genera is the leading provider of quarantine treatments including the phytosanitary treatment of export logs in New Zealand, Australia and throughout the Pacific.

Genera is the largest single documented user of methyl bromide worldwide.

New Zealand ranks second by country in world methyl bromide emissions.

Genera has gained experience using EDN during log fumigation trials in New Zealand and soil fumigation trials in Australia.

Genera is actively pursuing all credible alternative phytosanitary treatments and recapture technologies.

Genera understands that there are a limited number of credible alternatives.

Genera sees EDN as a credible alternative to methyl bromide in many applications.

Genera supports the registration application made by Draslovka.
