Nordiko Methyl Bromide Recapture

To whom it may concern,

Further to our discussions on Thursday, 23rd July regarding Nordiko's methyl bromide technology. I wanted to further highlight the following important points below:

- Nordiko's recapture technology has been successfully applied to large under-tarp log stack fumigations in Colac, Victoria with the Pentarch Group. A large scale recapture system on a mobile trailer was supplied in 2010,
- Nordiko has supplied a number of recapture equipment to Genera from 2008, for use at their Nelson, Wellington and Tauranga fumigation sites, mainly for shipping container fumigations,
- Nordiko has supplied recapture equipment to Rentokil NZ for their Port of Auckland fumigations,
- Nordiko disposes waste material derived from MB recapture through a 3rd party (ChemWaste) in New Zealand at approved waste disposal sites
- Nordiko is able to recapture methyl bromide from typical sized log stack fumigation at Port of Tauranga (500-1,000m³)
- Nordiko is able to supply recapture equipment for all the MB fumigations being conducted at the Port of Tauranga (250tpa) within a 6-12 months implementation plan
- Nordiko is also able to design and supply recapture equipment for the proposed rail facility to fumigate in sheds that are 25,000m³ in volume

Nordiko is willing to demonstrate our recapture technology in New Zealand for log stack recapture. We have recapture equipment that will be suitable, stored in Auckland New Zealand which can be utilised at a given notice.
