Dear EPA/DMC,

Please find reef data and Word document explaining. I have found the GIS system to be very powerful and I think you can clearly see when the bathymetry, commercial polygons, and dive & fishing spots, plus Project Reef is shown, plus DOC reefs, and DOC habitat type – a much clearer picture starts to evolve.

Had there been diver survey, so the macro-algae density, sponges, and other benthos been identified, plus layers depicting fish species to be found in x spots, plus other eco-system layers added to this GIS system – then I believe the DMC would have ‘best available information’.

Kind regards,

Karen Pratt
